

Xolace — ElevenLabs Grant One-Pager

AI-native mental health, from confusion to care. Live on iOS and Android · 290 users
· 744 completed sessions · zero paid acquisition

What Xolace does

Xolace helps people reflect on what they are feeling in the moment: get clarity, understand what is underneath it, and catch what is compounding before it grows, so real support works when they reach for it.

A session works like a mirror. The user writes or speaks what is going on, and Xolace reflects it back in plain language. No diagnosing, no advice. Many users cannot find the words on their own, so the reflection itself is the product. When something clinical is needed, Xolace points them toward it rather than replacing it.

We sit in the gap between “everything is fine” and “I need a therapist”, the layer most tools skip.

How we use ElevenLabs today

In the product

- **Text to speech (`eLeven_v3`)** — every reflection can be read back to the user in a calm, fireside voice. Paid users choose from a small cast of voice personas (Sage, Wren, Vesper, Ash). Hearing it spoken lands differently than reading it, especially when someone is overwhelmed.
- **Speech to text (Scribe v2)** — our voice “vent” feature lets users talk instead of type. We transcribe the recording, respond to it, and speak the response back with `eLeven_v3`.

Outside the product

- Voiceover for a narrative video series on mental health awareness, told through a continuous storyline rather than talking-head explainers.
 - Voice generation for our ad creative.
-

ElevenLabs roadmap (building next)

- **Real-time conversational voice agent** for full vent sessions, so a user can talk something through out loud and be met in the same channel.
 - **Speech to text as the entry point** to a reflection session for free-tier users, making speaking the default way in, not an option.
 - **A generated catalog of wellness audio** — guided breathing, body scans, grounding, sleep, and topic-specific tracks (anxiety, OCD, stress) — built entirely with ElevenLabs voices, so the regulation layer of the app does not depend on licensing a stock meditation library.
-

Future partnership with ElevenLabs

We are building a meaningful part of Xolace on top of ElevenLabs, and we want the relationship to go past API usage.

- **Voice as a core surface, not a premium add-on.** A grant lets us move spoken reflections and voice entry to every user. That turns Xolace into a real-world showcase of ElevenLabs in a sensitive, high-trust domain.
 - **Co-developed voice library for mental health.** We would work with ElevenLabs to build and openly credit a catalog of calming, non-clinical voices tuned for regulation and reflection, a reference use case for wellbeing products.
 - **Design partner for conversational voice in mental health.** Real-time vent sessions push latency, tone control, and safety handling. We can be an early, structured feedback channel as the conversational agent stack matures.
 - **Distribution in an underserved market.** Xolace is built in Ghana for a population that is mostly mobile-first and often more comfortable speaking than writing. Voice-first mental health here is a market ElevenLabs is not yet visible in.
-

Team

Four founders, all technical, working full-time. We met as university classmates five years ago and have worked on Xolace together for over two years.

- **Nathaniel Adama (CEO)** and **Somuah (CTO)** — write all the code, mobile and backend.
- **Emmanuel (COO)** — outreach and user research.
- **Andrew (CMO)** — marketing and design, including the video series.

No non-founder has written code or shipped work. Everything is in-house. Based in Koforidua, Ghana.
